

Assignment – Operational Planning and Analysis

Brief:

You are supporting B2B operations for a skincare manufacturing brand.

You are given **raw order data** that includes multiple SKUs per order, retail and professional products, pricing, discounts, and tax details.

The data works for billing but is **not structured for operations or fulfilment tracking**.

Your task is to organise and enhance this data so it can be used for tracking, coordination, and decision-making. (Example – create a dashboard which is more user-friendly)

Task 1: Clean & Structure

- Clean and standardise the data
- Ensure all numeric fields are usable
- Handle unclear or missing data logically (mention assumptions)

Task 2: Add Operational Fields

Add the columns you believe are essential to run B2B operations smoothly.

Examples (not limited to):

- Product Type (Retail / Professional)
- Account Type (Retail-only / Retail + Professional)
- Order Owner / Account Manager
- Order Status / Fulfilment Stage
- Fulfilment Owner
- Priority or Delay Flag
- Expected Dispatch Date
- Internal Notes

Task 3: Order-Level View

Create an **order-level summary** that shows:

- Total order value
- Total quantity
- Number of SKUs
- Retail vs Professional mix
- Order status at a glance

Task 4: Summary & Insights

Create a short summary that shows:

- Orders and revenue by account
- Accounts ordering only retail vs professional products
- Top accounts by value
- Any clear patterns or risks you notice

Short Questions (Answer briefly)

1. What key information is missing from the raw data?
2. Which 3 fields would you make mandatory at order entry, and why?
3. If order volumes double, what part of this system will break first? (2–3 lines per answer.)
